Dissenter

How I have written the py file

- I used python selenium and used CSS selector or tag name to get the elements
- in dissenter browser the extension basically a modal in which the iframe of that URL is opening
- iframe URL = 'https://dissenter.com/discussion/begin-extension?url=https%3A%2F%2Fwww.google.com%2F'
- convert normal URL into iframe URL
- extract comment from that URL normal using CSS selector and saved into JSON dump
- code is properly commented out you can find the py file and code in this document also
